

BROWSERIFY: WHAT IT IS?

Browserify is a tool for compiling node like commonjs module for use on the browsers. It allows loading of third party modules for use on the browser.

HOW IT WORKS

Browserify recursively analyzes all `require()` method call in a source code to build a bundle you can serve on the browser in a single script.

PROS

You dont have to write code in node since browserify works both for frontend and backend JavaScript.

USE CASE:

Allows you to use require on browsers the same way you would do in Node.

The End!
